

Sunkid: The future begins now!
3D planning – VR presentation – Turn-key execution

Superlatives should be used with care. Too often, things thus advertised do not live up to expectations under closer scrutiny. Sunkid seems to have developed a new game changer after the invention of its conveyor belt with this novelty, however.

For the first time, Sunkid permits a view of future projects with unprecedented detail. A planning department created specifically for this purpose makes it possible now to experience future projects live using detailed 3D planning even before the decision to implement or even commencement of construction. It uses state-of-the-art technology, highly specific technical knowledge and satellite data to achieve this end.

The advantages of the Sunkid Innovation are clear:

Investment decisions by ski areas, ski schools and other stakeholders at a winter sports destination are often preceded by long discussion. It is not always possible to convince everyone involved. This is why it is decisive to integrate all parties in the best manner when planning projects already and to keep them informed. Technical drawings or the presentation on a map with dedicated product images usually only provide inaccurate ideas of reality. They can be hard to comprehend for persons who are not directly involved in the project, too. Project presentation by photorealistic 3D planning enables all parties to convince themselves of the future project live in advance.

Perfect implementation to the smallest detail. Mistakes in planning can be expensive, in particular in case of larger investments. Even small details are of central relevance in order to ensure experiences at the highest level for guests. No matter if planning a skiing school area, constructing a Kids Slope, purchasing new lifts or skiing conveyor belts: The Sunkid 3D planning solves such issues before they arise.

Long-term planning plays a decisive role in particular in projects that are to be implemented step by step across several years. The times are past when individual pieces of accessories and equipment were procured year after year, based on the available budget, without pursuing any clear line or objective. Sunkid will cooperate with their partners and customers to develop a comprehensive concept with a consistent line that spans an implementation period of several years.

Day-to-day business. The 3D plans can help in the daily processes of a skiing school, for example, as well. When figures and other tools must be removed to prepare the slope, they often are not put back where they originally were anymore. The precise plans and photorealistic presentation now provide clear setup plans that ensure sustainably high quality.

Recognising and using potentials is part of the basics for any entrepreneur. While it sounds easy, it is often quite complex in practice. Too often, a certain "blinkered attitude" or "operational blindness" will cause people to simply overlook certain options and opportunities. That is where a perspective change can be the solution. Precise details, virtually accessible views that can be inspected from all perspectives, and plans for a specific location or project permit new points of view and help access previously unused potentials.

We invite you – See for yourself: Let us convince you of the great potential of this Sunkid Innovation. Contact us and let us come to you in person to surprise you with entirely new perspectives in planning and construction of your future projects.
